

ABSTRACT OF THE DISCLOSURE

A wound dressing product has a web-shaped wound dressing element having an adhesive surface. A cover arrangement is provided for covering the adhesive surface, wherein the cover arrangement has at least two cover elements. At least one removal aid is connected to at least one of the cover elements for facilitating removal of the cover elements from the wound dressing element. The cover elements are separated from one another by a partition line. The removal aid that is connected to the associated cover element extends in a direction away from the partition line and away from the opposed cover element and overlaps the associated cover element.
